PY-EXPO 2026

Team Name - PyVipher Squads

Problem Statement ID - PY006

Problem Statement Title- VipherAid - street Animal Rescue Platform

Domain- Web development

PS Category- Software

Industry Mentor -

Student Mentor - Mirdula

TEAM DETAILS

S.No.	DEPARTMENT	ROLL NO	Role	NAME
1	AIDS	711725UAD133	Project Lead & Backend Developer	Harini N
2	AIDS	711725UAD104	Frontend Developer	Abinesha V
3	AIDS	711725UAD121	Database Management	Charan K
4	CSE	711725UCS115	Rescue Dashboard Module	Anushree A P
5	CSE	711725UCS111	GPS & Image Integration	Angelin B
6	CSE	711725UCS108	Documentation & Testing	Anbuselvam A
7	Mirdula			

VipherAid

Proposed Solution:

To Develop VipherAid, a web-based platform to report injured or animal in distress.
Built using Flask (Python), HTML, CSS, JavaScript, and SQLite database.
Users can quickly submit a report with:

- Location of the animal using GPS.
- Photo upload
- Contact details

Reports are stored in the system and shown on a rescue dashboard for rescuers or NGOs.
Additional features include emergency reporting, shelter information, and donation support.

It provides a centralized platform to report animals in distress by building a bridge between Rescuers,Citizens, NGOs and Shelters .

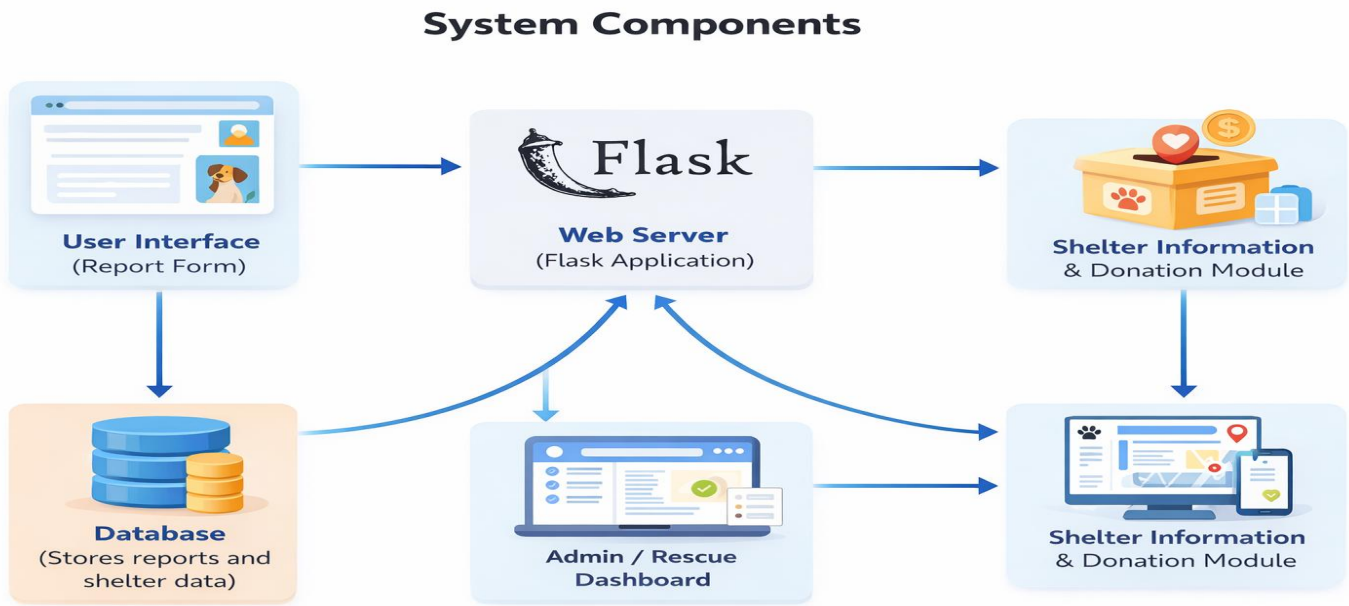

Unique features compared to other existing platforms:

- Encourages community participation in animal rescue.
- Combines reporting, shelter information, and donation support in one platform.
- Allows photo uploads and live GPS routing for better case understanding.
- Provides emergency priority tagging for urgent cases.

Tech Stack

- Frontend: HTML, CSS, JavaScript
- Backend: Python – Flask
- Database: SQLite
- Version Control: Git
- Development Environment: Visual Studio Code

Block Diagram

Flow of the Project

1. User (Reporter) visits the Home Page of the VipherAid website.
2. The reporter clicks the Emergency Report button.
3. The system automatically detects the location using GPS.
4. The reporter is asked to upload a photo of the animal.
5. The system collects details such as animal type and description.
6. A rescue report is automatically generated with location, image, and details.
7. The report is stored in the database.
8. The report appears on the Rescue Dashboard.
9. Rescuers view the dashboard and check the report details.
10. The rescue team assigns the case and takes rescue action.
